

Millennium bcp

Financial and banking analysis

2022-2025 history | H1 2026 actuals | 2026-2028 illustrative scenarios

Ricardo Seródio | English edition | Revised 29 September 2026

H1 2026 net income	Reported ROE	NPE ratio	Source register
EUR 565.8m	14.6%	2.2%	182 observations

Executive reading

Earnings increased alongside operating profit, while lower other impairments and provisions also made a substantial contribution. Credit impairment charges rose. These movements should be read together rather than treating higher net income as evidence that every risk indicator improved.

The scenario reference now uses a 48% residual profit conversion factor, with explicit sensitivities at 46%, 50% and the previous 50.2621%. Capital retention is a separate exercise. CET1 and reported-basis ROE/ROA are not forecast because this model does not reconstruct their required denominators and regulatory adjustments.

Reading route

Part	Pages in this combined document
Analysis, reconciliation and revised scenarios	1-10
Native Power BI historical and H1 2026 views	11-19
Guide to analysis and the 18 historical ratios	20-33
Complete historical validation appendix and sources	34-40

The nine native Power BI pages retain the validated historical export. Its former forecast page is replaced by the revised scenario charts in this report. The public repository provides the 29 September calculation package separately from the preserved v5 Power BI model.

Educational portfolio project. Not affiliated with Millennium bcp. No investment recommendation, valuation or probability forecast. [Public project repository](#)

01 / Annual history

EUR million. Full-year Group values; customer loans are net of allowances. Annual releases retain their documented source vintages rather than a single fully restated series.

Metric	2022A	2023A	2024A	2025A
Net interest income	2,149.8	2,825.7	2,830.9	2,898.1
Fees and commissions	771.9	771.7	812.7	847.4
Operating income	2,867.5	3,769.7	3,573.5	3,815.2
Operating costs	1,073.0	1,162.6	1,306.1	1,415.1
Net income	207.5	856.0	906.4	1,018.6
Customer loans	56,198.0	55,218.0	56,850.0	61,240.0
Total assets	89,861.0	94,371.0	102,144.0	109,333.0
Equity	5,921.0	7,290.0	8,193.0	9,061.0
Net credit impairments	300.6	240.0	183.3	199.5
Other impairments and provisions	755.6	859.8	674.2	625.9
Impairments and provisions	1,056.2	1,099.8	857.5	825.4
Deposits and other customer resources	75,907.0	77,928.0	84,042.0	89,749.0
Total customer funds	92,808.0	95,328.0	102,938.0	111,782.0

Reported ratio (%)	2022A	2023A	2024A	2025A
ROE	4.0	15.3	13.8	14.1
Net interest margin	2.46	3.36	3.04	2.89
Cost-to-income ratio	37.4	30.8	36.5	37.1
NPE ratio	3.8	3.4	3.1	2.4
LCR	212.0	276.0	342.0	334.0
CET1 fully implemented ratio	12.5	15.4	16.3	15.9

2022 comes from FY2022; 2023 from FY2024 comparative; 2024 and 2025 from FY2025. Per-share measures use annual report tables. The appendix records every source and page. Impairments and provisions is the sum of credit and other impairments; modification results are separate.

02 / Half-year update

H1 2026 versus restated H1 2025. Income items cover six months; balance-sheet items refer to 30 June. EUR million unless stated otherwise.

Metric	H1 2025	H1 2026	YoY calc.
Net interest income	1,444.1	1,493.8	3.4%
Fees and commissions	413.8	438.0	5.8%
Operating income	1,848.0	1,950.3	5.5%
Operating costs	683.5	720.2	5.4%
Net credit impairments	89.8	104.4	16.3%
Other impairments and provisions	280.6	188.5	-32.8%
Net income	502.3	565.8	12.6%
Customer loans	58,839.0	63,836.0	8.5%
Deposits and other customer resources	85,950.0	93,249.0	8.5%
Total assets	105,466.0	114,800.0	8.9%
Equity	8,404.0	9,562.0	13.8%

Net income growth is officially 12.7%. Rounded million figures produce 12.6%; the precise reported amounts, EUR 565.832m and EUR 502.276m, round to 12.7% growth.

Reported ratio	H1 2025	H1 2026	Unit
ROE	14.3	14.6	%
Net interest margin	2.97	2.83	%
Cost-to-income ratio	37	36.9	%
Cost of risk	30	32	bps
NPE ratio	2.7	2.2	%
NPE coverage ratio	84.5	97.2	%
Loan-to-deposit ratio	68.5	68.5	%
LCR	336	326	%
NSFR	181	183	%
CET1 fully implemented ratio	16.2	15.1	%

Reverse repos are excluded from loans (EUR 96m impact in June 2025); repos are excluded from deposits (no impact on that comparative). Capital ratios are estimates including 10% of unaudited H1 2026 earnings. [H1 2026, pp. 2-4 and 30](#)

03 / What drove the earnings increase?

A complete bridge avoids confusing pre-tax contributions with the final increase attributable to shareholders. Values below follow the management income statement, EUR million.

Component	EUR million
H1 2025 net income	502.3
Higher pre-provision operating profit	+65.7
Higher credit impairment charge	-14.6
Lower other impairments and provisions	+92.1
Improvement in modification results	+4.3
Higher income taxes	-64.3
Higher non-controlling interests	-19.7
H1 2026 net income	565.8

Operating improvement and lower other provisions both contributed materially. The latter was the largest positive bridge component, but it does not alone explain net income growth: tax and minority-interest movements offset part of the gains.

Pre-provision profit is taken directly from the source table (1,230.1 versus 1,164.4). Subtracting separately rounded headline income and cost figures can differ by EUR 0.1m. The displayed bridge reconciles exactly to the EUR 63.5m increase. [H1 2026 management income statement, p. 29](#)

04 / Why did NPE coverage improve?

Group balance-sheet measure	Dec 2025	Jun 2026	Change
NPE stock (EUR m)	1,503	1,442	-61
Total credit allowance stock (EUR m)	1,366	1,402	+36
Total allowance / NPE	90.9%	97.2%	+6.3 pp

The improvement comes from both a smaller NPE denominator and a higher total allowance numerator. It should not be described simply as a large new provision expense: allowances are a balance-sheet stock, while the impairment charge is an income-statement flow.

Sequential arithmetic decomposition	Coverage
Starting coverage: 1,366 / 1,503	90.88%
Hold allowances fixed; reduce NPE to 1,442	94.73%
Then increase allowances to 1,402	97.23%

This ordering attributes approximately 3.84 pp to the smaller denominator and 2.50 pp to the larger numerator. Attribution changes slightly if the order is reversed; the total does not. It is a ratio decomposition, not an explanation of all NPE recoveries, sales or write-offs.

The 97.2% ratio uses total loan allowances, including performing exposures. Coverage by allowances specifically allocated to NPE is 55.1% in June 2026. These are different measures, not interchangeable definitions.

Period alignment matters: the H1-to-H1 comparison is 84.5% to 97.2%; the December-to-June comparison is 90.9% to 97.2%. Annual source vintages are retained; H1 2026 restatements exclude repos/reverse repos as described in the source.

[FY2025, p. 20](#) | [H1 2026, p. 19](#)

05 / Operating scenarios and assumptions

Six operating drivers across three scenarios and three years give 54 explicit inputs. In 2026, growth rates apply to H2/H1 flows or December/June stocks. Later growth is annual. The 48% profit-conversion reference is common to all scenarios.

Conservative

Driver	2026E	2027E	2028E	Unit
Net interest income growth	-3	-2	0	%
Other income growth	0	1	1	%
Operating cost growth	4	5	4	%
Credit-risk charge assumption	60	65	70	bps
Net loan growth	1	2	2	%
Deposit/resource growth	1	2	2	%

Base

Driver	2026E	2027E	2028E	Unit
Net interest income growth	0	2	3	%
Other income growth	2	3	3	%
Operating cost growth	2	4	3	%
Credit-risk charge assumption	40	40	45	bps
Net loan growth	3	4	4	%
Deposit/resource growth	2.5	4	4	%

Optimistic

Driver	2026E	2027E	2028E	Unit
Net interest income growth	3	4	4	%
Other income growth	4	4	4	%
Operating cost growth	1	3	2.5	%
Credit-risk charge assumption	30	30	35	bps
Net loan growth	4	5	5	%
Deposit/resource growth	3.5	5	5	%

Why 40 bp in Base? This is a cautious normalisation assumption near the 39 bp disclosed for FY2024 excluding a specific reversal. It is above the latest 32 bp and is not bank guidance. The 45 bp in 2028 is an additional chosen stress, not an observed trend.

The charge uses projected net loans, a disclosed proxy for the issuer denominator. $H2 \text{ charge} = \text{closing net loans} \times \text{annual bp} / 10,000 \times 0.5$. The annual 2026 realised-plus-estimated charge need not equal the H2 assumption. [FY2025, p. 3, note 4](#)

06 / Revised operating outcomes

Year	Scenario	Profit EUR m	Cost/income %	Loans/deposits %
2026E	Conservative	1,028.1	38.10	68.46
2026E	Base	1,090.6	37.21	68.79
2026E	Optimistic	1,135.3	36.52	68.79
2027E	Conservative	881.2	40.53	68.46
2027E	Base	1,061.1	37.85	68.79
2027E	Optimistic	1,162.6	36.17	68.79
2028E	Conservative	835.8	42.05	68.46
2028E	Base	1,074.6	37.85	68.79
2028E	Optimistic	1,201.3	35.65	68.79

At the 48% reference, Base produces H2 2026 profit of approximately EUR 524.8m and full-year profit of EUR 1,090.6m. H1 actual profit remains EUR 565.8m. The historical 2025 result is EUR 1,018.6m.

These are deterministic outcomes conditional on inputs, not probabilities, confidence intervals or statistically calibrated predictions. CET1 and ROE/ROA projections have been removed; no unsupported capital path or comparison across ROE definitions is displayed.

07 / Sensitivity to profit conversion

Conversion = net income / (operating income - operating costs - credit impairments). It absorbs other impairments, modifications, taxes and non-controlling interests. It is not a tax rate.

Historical calibration	Conversion factor
H1 2025: 502.3 / (1,848.0 - 683.5 - 89.8)	46.74%
FY2025: 1,018.6 / (3,815.2 - 1,415.1 - 199.5)	46.29%
H1 2026: 565.8 / (1,950.3 - 720.2 - 104.4)	50.26%

48% is an illustrative reference within this observed range, not a statistical estimate or a claim about a normal long-run level. A fall in provisions alone does not establish that H1 2026 is abnormal. The sensitivity range is chosen, not a confidence interval.

Base operating path	2026E EUR m	2027E EUR m	2028E EUR m
46.00%	1,068.7	1,016.9	1,029.8
48.00% - reference	1,090.6	1,061.1	1,074.6
50.00%	1,112.5	1,105.3	1,119.3
50.26%	1,115.3	1,111.1	1,125.2

Only forecast profit conversion changes here: H1 2026 actuals and operating drivers remain fixed. Each factor is applied consistently to forecast periods. A stronger model would forecast the residual components separately and allow their paths to vary by scenario.

08 / Capital policy and comparability

Retention is separated from operating performance. The table holds Base operating assumptions and the 48% conversion factor fixed, then varies the fraction of forecast earnings retained. Higher retention is not labelled a better operating outcome.

Retention assumption	2026E equity	2027E equity	2028E equity
0%	9,562.0	9,562.0	9,562.0
10%	9,614.5	9,720.6	9,828.0
20%	9,667.0	9,879.2	10,094.1

EUR million. Start from June 2026 book equity of EUR 9,562m. For 2026, add only retained H2 forecast earnings because June equity already includes H1. Later years add retained full-year earnings. This isolates retention; it omits OCI, capital transactions, AT1 distributions and other equity movements.

Why there is no projected CET1

CET1 ratio = eligible CET1 regulatory capital / risk-weighted assets. A defensible projection requires both quantities on a consistent regulatory basis, including distributions, deductions and RWA composition. Accounting retained earnings do not map one-for-one into CET1. The earlier direct CET1 assumptions have therefore been withdrawn from projected outputs.

Historical June 2026 CET1 remains 15.1% fully implemented, estimated by the issuer including 10% of unaudited H1 earnings. That regulatory inclusion assumption must not automatically become an economic retention policy. [H1 2026, pp. 1-3](#)

Why projected ROE/ROA are omitted

The earlier proxy divided profit by closing total equity/assets. Issuer ROE uses adjusted average equity and an adjusted numerator; issuer ROA also has its own numerator and average balance. A visual drop across those definitions is not evidence of deterioration. The guide retains the historical ratio definitions; this revision does not project them.

09 / Validation, scope and reproduction

Revision check	Result
Core historical register	182 observations: 124 annual + 58 interim
Historical classifications	176 Source verified + 6 Recalculated
Supplementary source register	19 records for bridge, coverage and normalisation; includes overlaps with core register
Operating drivers	54 values plus one common reference conversion factor
Independent calculation check	81 forecast financial cells recomputed from compounded inputs
Conversion sensitivity	36 scenario / year / factor combinations
Retention sensitivity	27 scenario / year / policy combinations
Earnings bridge	$502.3 + 65.7 - 14.6 + 92.1 + 4.3 - 64.3 - 19.7 = 565.8$
Scope restriction	No projected CET1 or reported-basis ROE/ROA

The 182-cell appendix remains the historical register. The 19-record supplementary register supports this revision and must not be added to 182 as if all records were new unique observations. The earlier v5 SQL and Power BI checks relate to the historical publication package, not a refreshed v6 semantic model.

Reproduction package

The companion folder Revision calculations contains the input CSVs, revised scenario outputs, source register, methodology, calculation script and checks. Run `reproduce_model.py` to rebuild data and checks. The combined PDF records the assumptions and principal outputs so the analysis can also be followed without code.

The current scenario code and CSVs are in revisions/2026-09-29. Root-level legacy scenario files and the v5 PBIX preserve the previous model; use the revision package for the outcomes in this document. [Current revision package](#)

Source verified means checked against the identified source. Model checked means the arithmetic was recomputed. Neither implies an independent audit, external certification or predictive validation. Data remain subject to issuer estimates, source vintages and rounding.

Charts use zero baselines for bars. Historical line charts retain fitted scales with visible data ranges; those scales should not be used to compare the visual size of changes across different metrics. All financial tables retain their units.

UNDERSTANDING THE STUDY

Banking analysis and financial ratios

Millennium bcp | A step-by-step companion

Ricardo Serôdio · English · Revised 29 September 2026

Three questions guide the reading:
Does the bank generate earnings? What risks does it take to earn them? Does it have funding and capital to support its business?

This guide explains all 18 historical indicators and the revised scenarios. The report contains the numerical earnings and coverage bridges. It accompanies the dashboard and appendix; it does not replace the official disclosures. Formulas distinguish issuer definitions from model approximations.

Reading route	Pages
Foundations and results	2-3
Profitability and per-share figures	4-5
Efficiency, loan-to-deposit and risk	6-7
Liquidity and capital	8-9
Scenarios and conclusions	10-11
Validation, labels and dashboard	12-13
Sources and reproduction	14

Scope: annual history 2022-2025; H1 2025/H1 2026; scenarios 2026-2028. Information cut-off: 28 September 2026. Educational public-source project, unaffiliated with the bank and without an investment recommendation.

1. The foundation of the analysis

The question is how Group earnings, efficiency, risk, liquidity and capital evolved. We collected official data, recorded source documents and pages, separated periods and units, and built a reproducible chain.

Official sources → CSV and source register → Python → SQLite/SQL → Power BI → reports and appendix

Concept	Meaning and caution
Flow	Earnings, revenue or expense accumulated over a period. A half-year is not a full year.
Stock	Loans, deposits, assets or equity at a date. Do not add June and December balances.
Gross and net	Net loans reflect impairment deductions. Risk ratios may use gross loans as their denominator.
Operating income	Management aggregate including net interest income, fees and other net income. It is not bottom-line profit.
Customer funds	Deposits, on-balance-sheet resources and total customer funds have different scopes; off-balance-sheet funds are not deposits.

Units. Amounts are EUR million unless stated otherwise. EPS and book value per share are euros per share. 1 percentage point (pp) = 100 basis points (bp). A ratio falling from 2.7% to 2.2% declines by 0.5 pp, or 50 bp; its relative change is -18.5%.

Comparability. Annual history retains documented disclosure vintages, not one uniformly restated series. Both half-years come from the same publication, with restated comparatives. Statutory statements and management indicators can aggregate items differently.

In dataset codes, A means actual and E estimated. H1 identifies the first half-year; H2 the second. FY denotes the full year.

Source: [Project methodology and register](#)

2. What happened at the bank

Annual history	2022	2023	2024	2025
Group net income (EUR m)	207.5	856.0	906.4	1,018.6
ROE (%)	4.0	15.3	13.8	14.1
NPE (%)	3.8	3.4	3.1	2.4

History shows an earnings recovery and a lower share of problem credit. The path is not linear: ROE and efficiency fluctuate. We do not attribute these changes to a single cause or treat reclassifications as organic growth.

Half-year comparison	H1 2025	H1 2026
Net income (EUR m)	502.3	565.8
Operating income (EUR m)	1,848.0	1,950.3
Operating costs (EUR m)	683.5	720.2
Credit impairment charge (EUR m)	89.8	104.4
Other impairments/provisions (EUR m)	280.6	188.5

Earnings growth combines higher income with lower other impairments and provisions. Operating costs and credit impairment charges rose. Higher profit therefore does not mean every cost or risk declined.

Rounding: the bank reports 12.7% net income growth. Using the published rounded million amounts, 565.8 and 502.3, gives 12.6%. Using the more precise amounts of 565.832 and 502.276 (p. 30), growth rounds to 12.7%.

Source: [H1 2026 results](#), pp. 2, 29-30; [annual series in the appendix](#)

3. Profitability: ROE, ROA and NIM

ROE | Return on equity

Formula: Profit attributable to shareholders, after AT1 coupons / adjusted average equity × 100.

Measures the return on shareholder capital. The issuer excludes, among other items, non-controlling interests and specified capital instruments from its equity definition. The reported half-year ratio is annualised: it is not the return earned in six months. Higher ROE may reflect more profit or a smaller capital base.

ROA | Return on assets

Formula: Profit after tax, including non-controlling interests / average assets × 100.

Assesses the ability of assets to produce earnings. The official numerator is not only profit attributable to the bank shareholders. Dividing Group net income by closing assets therefore does not reproduce reported ROA. Compare similar businesses using the same calculation basis.

NIM | Net interest margin

Formula: Net interest income / average interest-earning assets × 100.

Net interest income is interest income less interest expense. NIM turns that amount into a ratio. Net interest income in euros may rise while NIM falls if asset volumes or composition change. It is not the interest rate charged on an individual loan.

Reported ratio	H1 2025	H1 2026
ROE	14.3%	14.6%
ROA	1.1%	1.2%
NIM	2.97%	2.83%

In this revision: ROE and ROA projections are omitted. The earlier closing-balance proxies did not reproduce the issuer definitions and must not be compared directly with historical reported ratios.

Interim ROE, ROA and NIM must retain the issuer's annualisation and average-balance conventions. These formulas describe the economic relationship; they do not replace every adjustment needed to reproduce the exact ratio.

Source: [Issuer glossary](#), pp. 32-33

4. Per-share indicators

EPS | Earnings per share

Formula: Profit attributable to ordinary shareholders, after applicable adjustments / weighted-average ordinary shares outstanding.

BCP's reported definition deducts AT1 coupons. The weighted average reflects how long shares were outstanding; it is not simply the last-day share count. Basic EPS differs from diluted EPS when dilutive instruments exist. The study retains the source-reported EPS.

Book value per share | BVPS

Formula: Book equity attributable to the source-defined share base / relevant shares net of treasury shares.

This is an accounting measure at a date. It is neither the share price nor a guaranteed liquidation value. Do not automatically divide total consolidated equity, which includes non-controlling interests, by any available share count.

Reported annual values (EUR per share)	2022	2023	2024	2025
Basic EPS	0.011	0.054	0.058	0.066
Book value	0.314	0.417	0.469	0.528

EPS can rise because of higher profit, fewer shares or both. Before comparing periods, check buybacks, issuance and changes in capital structure. This guide does not infer a price target from these figures.

5. Efficiency is not loan-to-deposit

Efficiency | Cost-to-income

Formula: $\text{Operating costs} / \text{operating income} \times 100$.

How much it costs to generate income. Lower generally means greater efficiency, but cuts that damage service or future capacity need context. The complement to 100% is not the net profit margin: impairments, tax and other items remain.

Cost-to-income excluding specific items

Formula: $\text{Adjusted operating costs} / \text{operating income on the source-specified adjusted basis} \times 100$.

Removes specific effects identified by the bank. Do not select only the measure that looks better. In the 2026 summary, the relevant adjustments relate to personnel costs.

Loan-to-deposit | Funding transformation

Formula: $\text{Net loans} / \text{deposits and other customer resources} \times 100$.

Relates lending to a funding source. It does not measure costs or productivity. Lower is not automatically better; assess how funds are used, other funding sources and liquidity.

Loans / on-balance-sheet customer resources

Formula: $\text{Net loans} / \text{on-balance-sheet customer resources} \times 100$.

The denominator expands to the bank-defined on-balance-sheet resources, including debt placed with customers. It excludes off-balance-sheet customer funds. The 2026 figure is 67.2%, different from the 68.5% loan-to-deposit ratio.

2026 examples: $720.2 / 1,950.3 \times 100 = 36.9\%$ cost-to-income.

$63,836 / 93,249 \times 100 = 68.5\%$ loan-to-deposit.

Per EUR 100 of income: EUR 36.90 of costs. Per EUR 100 of deposits/other resources: EUR 68.50 of net loans.

Source: [H1 2026 results](#), pp. 2-4, 20 and 33

6. Credit quality and impairments

NPE | Non-performing exposures

Formula: $\text{Credit NPE} / \text{gross loans within the same scope} \times 100$.

Indicates the share of problem credit. It covers past-due and unlikely-to-pay situations, not only instalments overdue by 90 days. A decline can reflect recoveries, sales, write-offs or denominator growth.

NPE coverage by impairment allowances

Formula: $\text{Total loan impairment allowance stock on the balance sheet} / \text{NPE stock} \times 100$.

Measures accounting coverage, not cash set aside in an account. The numerator includes allowances across the loan book, not only allowances specifically allocated to NPE. High coverage does not guarantee full recovery or eliminate risk.

Restructured loans ratio

Formula: $\text{Restructured loans} / \text{gross loans within the same scope} \times 100$.

Shows the share of contracts restructured under the source definition. It is not synonymous with NPE: restructured loans may be performing. Read alongside new defaults and recoveries.

Cost of risk | bp

Formula: $\text{Credit impairment charge net of recoveries} / \text{bank-defined loan base} \times 10,000$, annualised for interim periods.

This is a period expense. The reported basis uses closing amortised-cost loans and associated debt securities before allowances. The model uses projected net loans instead: a different approximation. 32 bp means 0.32% annualised, not 32% credit losses.

Do not confuse: balance-sheet impairment is an accumulated stock; the income-statement impairment charge is a flow. NPE coverage uses the former; cost of risk uses the latter.

H1 2025 to H1 2026: NPE: 2.7% to 2.2%; coverage: 84.5% to 97.2%; restructured loans: 2.2% to 1.5%; cost of risk: 30 to 32 bp. Less problem credit can coexist with a higher risk charge.

Source: [Credit definitions and glossary](#), pp. 19 and 32

7. Liquidity: LCR and NSFR

Liquidity is the ability to meet payments when due. A bank can own valuable assets yet struggle to turn them into cash in time. These ratios therefore complement earnings and capital analysis.

LCR | Liquidity Coverage Ratio

Formula: Eligible high-quality liquid assets / net cash outflows in a 30-day stress scenario × 100.

Assets and flows receive the applicable regulatory treatment. An LCR of 326% represents 3.26 times modelled net outflows, not 326% of deposits held in cash. The normal regulatory reference is 100%; use of the buffer in stress is subject to supervisory treatment.

NSFR | Net Stable Funding Ratio

Formula: Available stable funding / required stable funding × 100.

Assesses the funding structure over a one-year horizon. Amounts are weighted for stability and funding needs; they are not a simple sum of deposits and loans. The minimum reference is 100%. A value of 183% equals 1.83 times the weighted requirement.

Question	LCR	NSFR
Horizon	30-day stress	One-year structure
Focus	Liquidity buffer	Stable funding
H1 2025 / H1 2026	336% / 326%	181% / 183%

Combined reading: LCR fell and NSFR rose. Both remained above 100%, but that does not establish absence of liquidity risk. Deposit concentration, currency, maturity and actual asset availability also matter.

Source: BIS: LCR

Source: BIS: NSFR

8. Capital: capacity to absorb losses

Accounting equity, regulatory capital and liquidity are distinct concepts. Capital ratios relate eligible own funds to risk-weighted assets (RWA). RWA reflect credit, market and operational risk; they are not total balance-sheet assets.

AT1 means Additional Tier 1: regulatory capital instruments in addition to CET1; Tier 2 is another eligible capital category. AT1 coupons are payments on those instruments.

CET1 phased-in | Transitional basis

Formula: CET1 capital under applicable transitional rules / RWA on the same basis × 100.

CET1 is the highest-quality component of regulatory capital, after adjustments and deductions. Phased-in incorporates applicable transitional treatments. A value of 15.3% means EUR 15.30 of CET1 per EUR 100 of RWA, not per EUR 100 of deposits.

CET1 fully implemented | Full application

Formula: CET1 capital on the fully implemented basis / RWA on that basis × 100.

Shows the measure without the transitional effects excluded by that presentation. Do not mix a numerator on one basis with a denominator on another. Applicable requirements include bank-specific components: this study does not calculate headroom over the total requirement.

Total capital fully implemented

Formula: (Eligible CET1 + Additional Tier 1 + Tier 2) / RWA × 100.

Includes other regulatory capital instruments in addition to CET1. Each category has its own loss-absorption conditions. A higher total ratio does not make every instrument equivalent to ordinary equity.

Basis	H1 2025	H1 2026
CET1 phased-in	16.4%	15.3%
CET1 fully implemented	16.2%	15.1%
Total capital	20.3%	19.3%

June 2026 ratios are estimated and include 10% of unaudited interim profit. The CET1 decline needs context on distributions, RWA and adjustments; it does not by itself demonstrate lower profit. This revision does not forecast CET1: eligible capital and RWA are not modelled.

Source: BIS: [definition of capital](#)

9. How the revised scenarios work

2026E adds actual H1 flows to estimated H2 flows. December balances are projected from June; balances are never added. Growth assumptions for later years are annual. Six operating drivers across three scenarios and three years give 54 input values.

2026E assumption	Conservative	Base	Optimistic
Net interest income	-3.0%	0.0%	3.0%
Other income	0.0%	2.0%	4.0%
Operating costs	4.0%	2.0%	1.0%
Credit risk (bp)	60.0 bp	40.0 bp	30.0 bp
Net loan growth	1.0%	3.0%	4.0%
Deposit/resource growth	1.0%	2.5%	3.5%

Estimated profit = (operating income - costs - credit impairments) x 48%.

H2 impairment = projected net loans x annual risk bp / 10,000 x 0.5.

2026 profit = actual H1 profit + estimated H2 profit.

48% is an illustrative reference, not an estimated tax rate or a statistically fitted normal level. It lies within observed conversion factors of about 46.3%-50.3%. The report shows sensitivities at 46%, 48%, 50% and the former 50.2621% calibration.

The conversion factor bundles other impairments, modification effects, taxes and minority interests. Those components are not separately forecast. Base risk of 40 bp is a cautious assumption near FY2024 adjusted 39 bp, above the latest 32 bp; the 45 bp in 2028 is an additional chosen stress.

Capital policy is separate: apply 0%, 10% or 20% retention to any operating scenario. For 2026 retain only H2 earnings. This isolated book-equity sensitivity omits OCI, buybacks and regulatory adjustments. It does not produce CET1.

10. What the revised scenarios show

Profit (EUR m)	Conservative	Base	Optimistic
2026E	1,028.1	1,090.6	1,135.3
2027E	881.2	1,061.1	1,162.6
2028E	835.8	1,074.6	1,201.3

The 48% reference gives Base profit of EUR 1,090.6m in 2026, including approximately EUR 524.8m in H2. Changes to conversion produce materially different results even with unchanged operating assumptions. See the report sensitivity table.

The paths are conditional calculations, not probabilities or confidence intervals. There is no out-of-sample predictive validation. The model does not forecast individual tax and other impairment components, regulatory capital, RWA or reported-basis ROE/ROA.

Supported conclusion: under these assumptions, the model produces these outcomes.

Unsupported conclusion: the bank will earn these profits, meet a projected CET1 ratio, or justify a particular share price.

The calculation package supplied with this revision contains all driver values, the independent arithmetic checks and separate conversion and retention sensitivities.

11. Validation: SV, RC, S1 and SHA

Label	What it means
SV - Source verified	Value checked against the specified official source, period and page. There are 176 historical observations.
RC - Recalculated	Total calculated from reported components. There are six sums: credit impairment charge + other impairments and provisions.
Model checked	Scenario formula or calculation reconciled; it does not mean the forecast is confirmed.
Scenario assumption	Input assumption selected for the model; it is not an actual bank observation.
S1 ... S7	Identifiers for seven sources. "S7 p2" means source 7, PDF page 2, counting the cover.
SHA-256	File fingerprint: 64 hexadecimal characters. It lets you check the exact byte version. It does not prove content accuracy or replace the official source.

What was checked. The historical register has 182 observations (124 annual and 58 interim). The revision independently recomputes 81 financial forecast cells from 54 operating inputs, and includes 36 conversion sensitivities and 27 separate retention sensitivities. The report reconciles the earnings bridge and coverage arithmetic.

Scope of validation. Source checks and arithmetic checks are different. The additional 19-record register includes overlaps with the core historical register. Earlier SQL and Power BI model checks apply to v5; the revised document does not claim a refreshed Power BI semantic model.

Traceability and tests make checks inspectable; they do not constitute an independent audit, external certification or a guarantee that no errors remain.

12. Reading the dashboard and concluding

Dashboard page	Question to ask
H1 2026 Update	Am I comparing equivalent half-years on the same restated basis?
Executive Overview	Do profitability, efficiency, risk and capital tell a consistent story?
Liquidity & Funding	What funding structure do LCR, NSFR and loan-to-deposit indicate?
Asset Quality	Are NPE, coverage and cost of risk moving in the same direction?
Profitability / Efficiency / Capital	Are denominators, periods and adjustments comparable?
Data Quality	Can I find the value, unit and source page in the appendix?
Revised scenario report	Which assumptions drive the outcome? Have I confused an assumption with a fact?

Our reading. Earnings and credit quality, measured by NPE and coverage, improved. Efficiency remains close to 37%. Counterweights include higher cost of risk, lower NIM and lower CET1. This reading requires assessing indicators together and retaining source qualifications.

A check you can perform. Choose one half-year profit figure, find its CSV and appendix row, open the official page and check value and unit. Then recompute efficiency and loan-to-deposit from page 6. Finally, change one scenario assumption conceptually and explain why the outcome should change.

Watch the scope. Page 4 of the release includes prudential indicators showing cost-to-income of 35.5% and loan-to-deposit of 64.4%. The dashboard uses the management summary indicators: 36.9% and 68.5%. This is not a relabelling; the calculation basis changes.

The work demonstrates a traceable analytical chain. Share fair value, peer comparison, probabilistic forecasting and a full capital-requirement assessment remain outside scope.

13. Sources and reproduction

The links below open source documents and code. Page references count PDF pages including the cover. The appendix contains observation-level locators and fingerprints of the evidence files used.
